A. Business problem/opportunity

Management needs a clearer view of what drives e-commerce revenue and where the business may be losing value or customer satisfaction. The analysis will use transaction, product, customer, discount, delivery, and rating fields to identify patterns worth investigating. Because the data is observational, the analysis can identify associations but cannot by itself prove that one factor caused another.

B. Questions the analysis will answer

Which product categories and products contribute the most to total revenue and transaction volume?

How does revenue vary by month, day of week, and location?

How do order quantity and revenue differ across discount levels or discount-applied groups?

Are longer delivery times associated with lower customer ratings?

Do customer age groups or gender groups show different purchasing patterns, where group sizes are sufficient?
